Scoreboard

Scoreboard: a bookkeeping technique

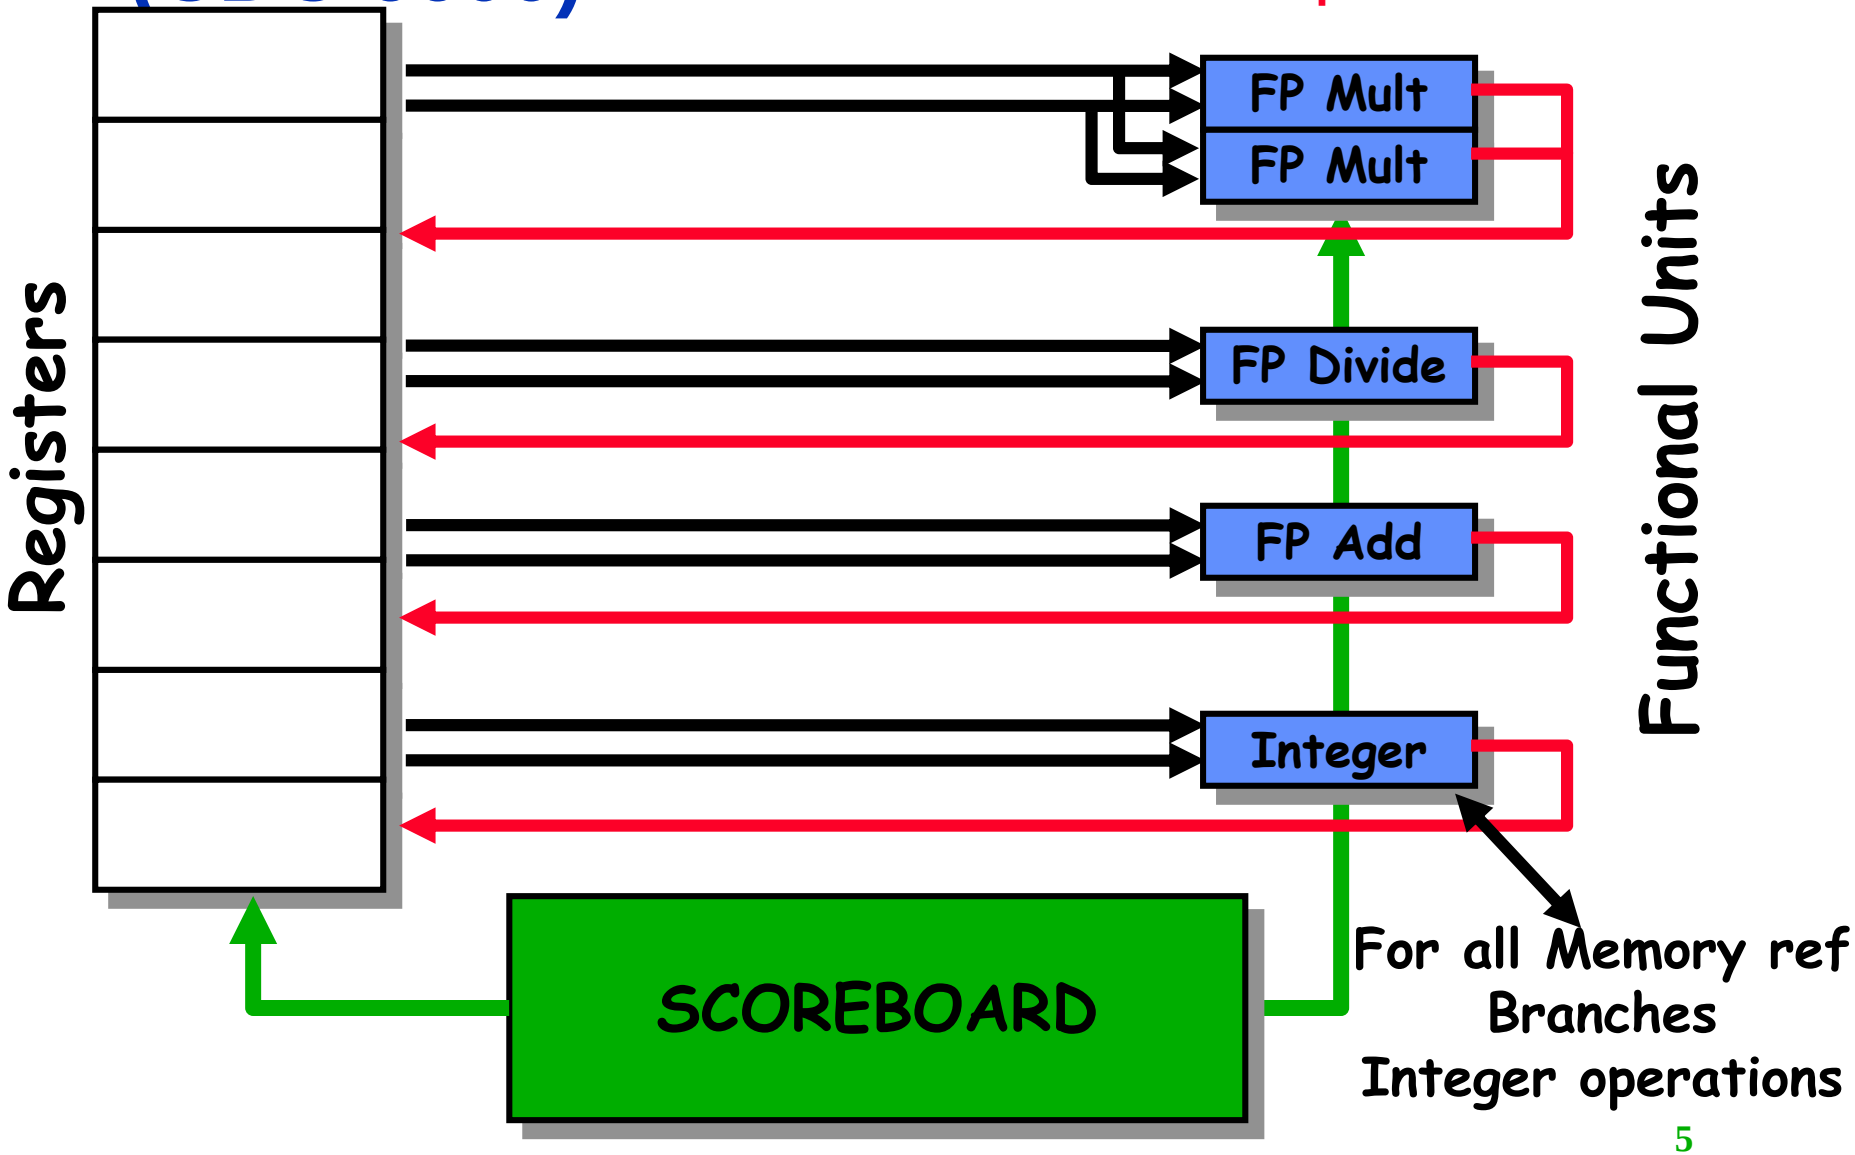
- **Out-of-order execution divides ID stage:**
  1. **Issue—decode instructions, check for structural hazards**
  2. **Read operands—wait until no data hazards, then read operands**
- **Scoreboards date to CDC6600 in 1963**
- **Instructions execute whenever not dependent on previous instructions and no hazards.**
- **CDC 6600: In order issue, out-of-order execution, out-of-order commit (or completion)**
  - **No forwarding!**

Scoreboard Implications

- **Out-of-order completion => WAR, WAW hazards**
- **Solutions for WAR:**
  - **Stall writeback until registers have been read**
  - **Read registers only during Read Operands stage**
- **Solution for WAW:**
  - **Detect hazard and stall issue of new instruction until other instruction completes**
- **No register renaming!**
- **Need to have multiple instructions in execution phase => multiple execution units or pipelined execution units**
- **Scoreboard keeps track of dependencies between instructions that have already issued.**
- **Scoreboard replaces ID, EX, WB with 4 stages**

Scoreboard Architecture (CDC 6600)

Assume multiple functional units



Four Stages of Scoreboard Control

- **Issue—decode instructions & check for structural hazards (ID1)**
  - Instructions issued in program order (for hazard checking)
  - Don’t issue if structural hazard
  - Don’t issue if instruction is output dependent on any previously issued but uncompleted instruction (no WAW hazards)
- **Read operands—wait until no data hazards, then read operands (ID2)**
  - All real dependencies (RAW hazards) resolved in this stage, since we wait for instructions to write back data.
  - No forwarding of data in this model

Four Stages of Scoreboard Control

- **Execution—operate on operands (EX)**
  - The functional unit begins execution upon receiving operands. When the result is ready, it notifies the scoreboard that it has completed execution.
- **Write result—finish execution (WB)**
  - Stall until no WAR hazards with previous instructions:

Example:

```
DIVD   F0,F2,F4
ADDD   F10,F0,F8
SUBD   F8,F8,F14
```

CDC 6600 scoreboard would stall SUBD until ADDD reads operands

Three Parts of the Scoreboard

- **Instruction status:**
  Which of 4 steps the instruction is in

- **Functional unit status:—Indicates the state of the functional unit (FU). 9 fields for each functional unit**
  - **Busy:** Indicates whether the unit is busy or not
  - **Op:** Operation to perform in the unit (e.g., + or –)
  - **Fi:** Destination register
  - **Fj,Fk:** Source-register numbers
  - **Qj,Qk:** Functional units producing source registers Fj, Fk
  - **Rj,Rk:** Flags indicating when Fj, Fk are ready

- **Register result status—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions will write that register**

Scoreboard Example

Instruction status:

Instruction		*j*	*k*	*Issue*	*Read Oper*	*Exec Comp*	*Write Result*
LD	F6	34+	R2				
LD	F2	45+	R3

Register result status:

Clock		F0	F2	F4	F6	F8	F10	F12	...	F30
62	*FU*									

- **In-order issue; out-of-order execute & commit**

Limitations of CDC 6600 Scoreboard

- No forwarding hardware
- Limited to the number of scoreboard entries
- Limited to the number of functional units (structural hazards), especially integer/load store units
- Do not issue on structural hazards
- Wait for WAR hazards
- Prevent WAW hazards

Summary

- **Increasingly powerful (and complex) dynamic mechanism for detecting and resolving hazards**
  - **In-order pipeline, in-order op-fetch with register reservations, in-order issue with scoreboard**
  - **Allow later instructions to proceed around ones that are stalled**
  - **Facilitate multiple issue**

- **Compiler techniques make it easier for HW to find the ILP**
  - **Reduces the impact of more sophisticated organization**
  - **Requires a larger architected namespace**
  - **Easier for more structured code**
